Qué es un microcontrolador (MCU)

Microcontrolador NodeMCU (ESP8266)

Velocidad de reloj: 80MHz / 160MHz

RAM: 128kB

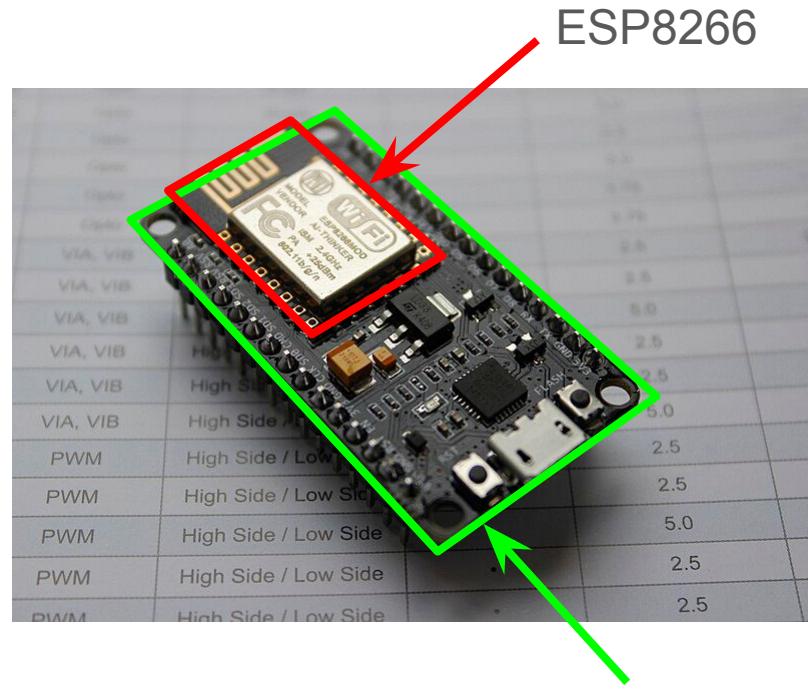

Flash: 4MB

Alimentación: USB (5V)

Voltaje de funcionamiento: 3.3V

WiFi integrada (802.11b/g/n)

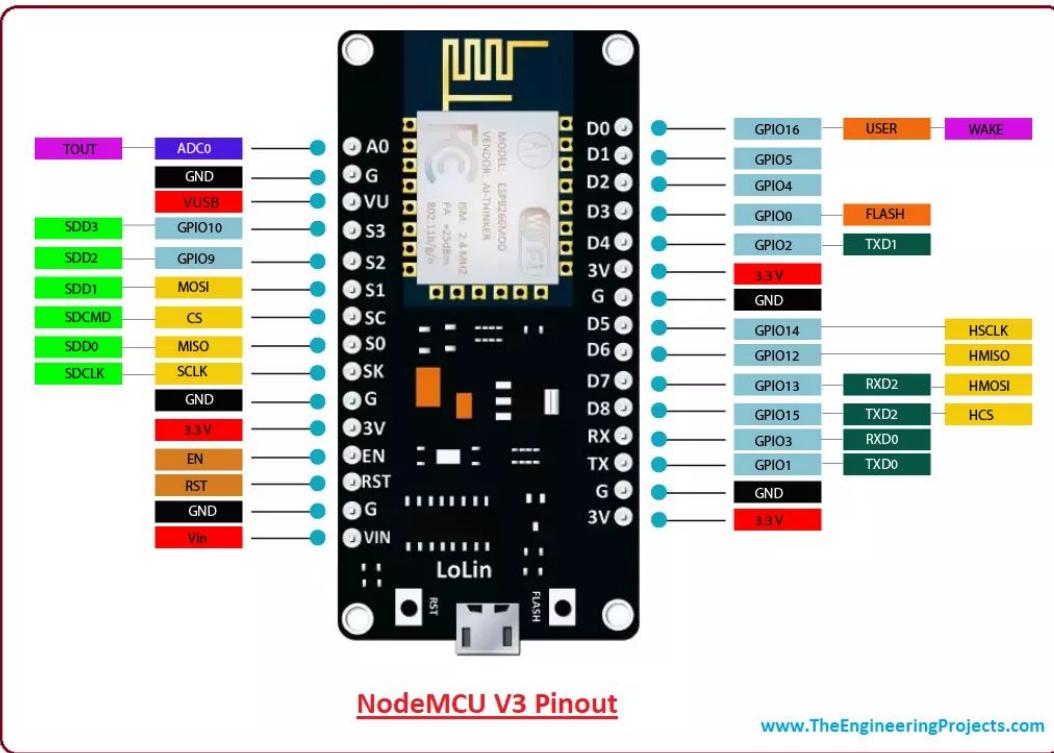

Costo: 3-5usd

NodeMCU

NodeMCU: pines

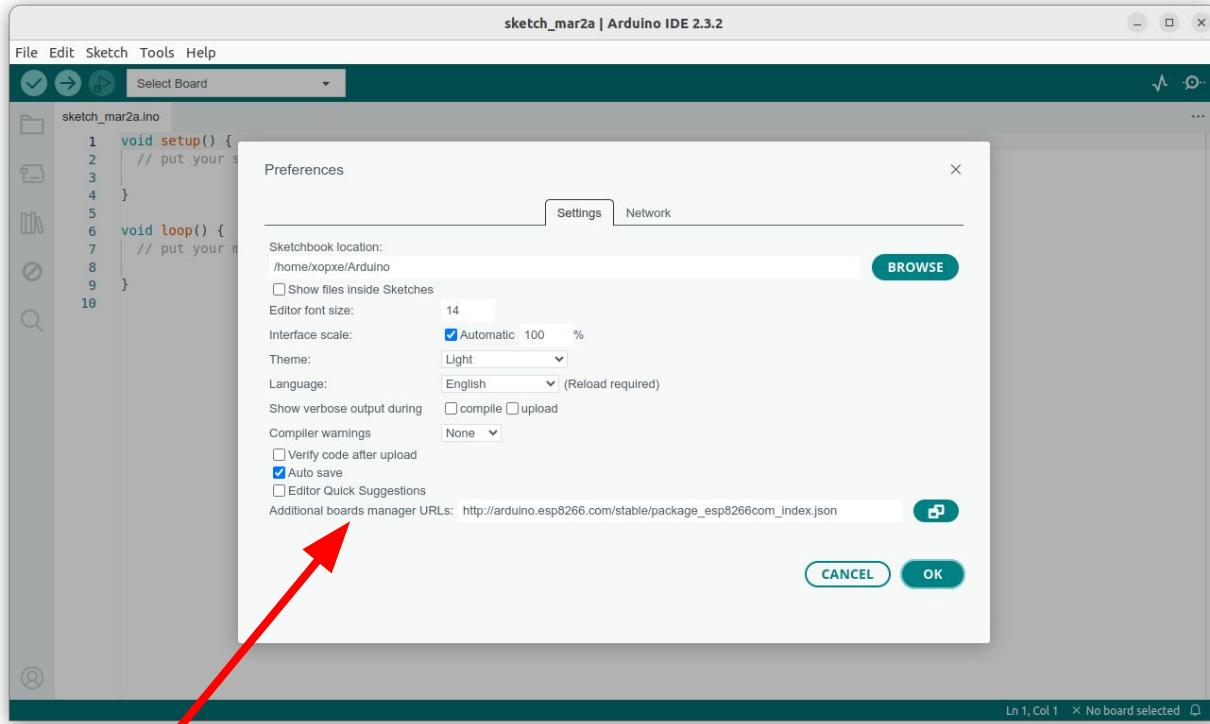

Label	GPIO	Input	Output	Notes
D0	GPIO16	no interrupt	no PWM or I2C support	HIGH at boot used to wake up from deep sleep
D1	GPIO5	OK	OK	often used as SCL (I2C)
D2	GPIO4	OK	OK	often used as SDA (I2C)
D3	GPIO0	pulled up	OK	connected to FLASH button, boot fails if pulled LOW
D4	GPIO2	pulled up	OK	HIGH at boot connected to on-board LED, boot fails if pulled LOW
D5	GPIO14	OK	OK	SPI (SCLK)
D6	GPIO12	OK	OK	SPI (MISO)
D7	GPIO13	OK	OK	SPI (MOSI)
D8	GPIO15	pulled to GND	OK	SPI (CS) Boot fails if pulled HIGH
RX	GPIO3	OK	RX pin	HIGH at boot
TX	GPIO1	TX pin	OK	HIGH at boot debug output at boot, boot fails if pulled LOW
A0	ADC0	Analog Input	X

Cómo se programa un MCU

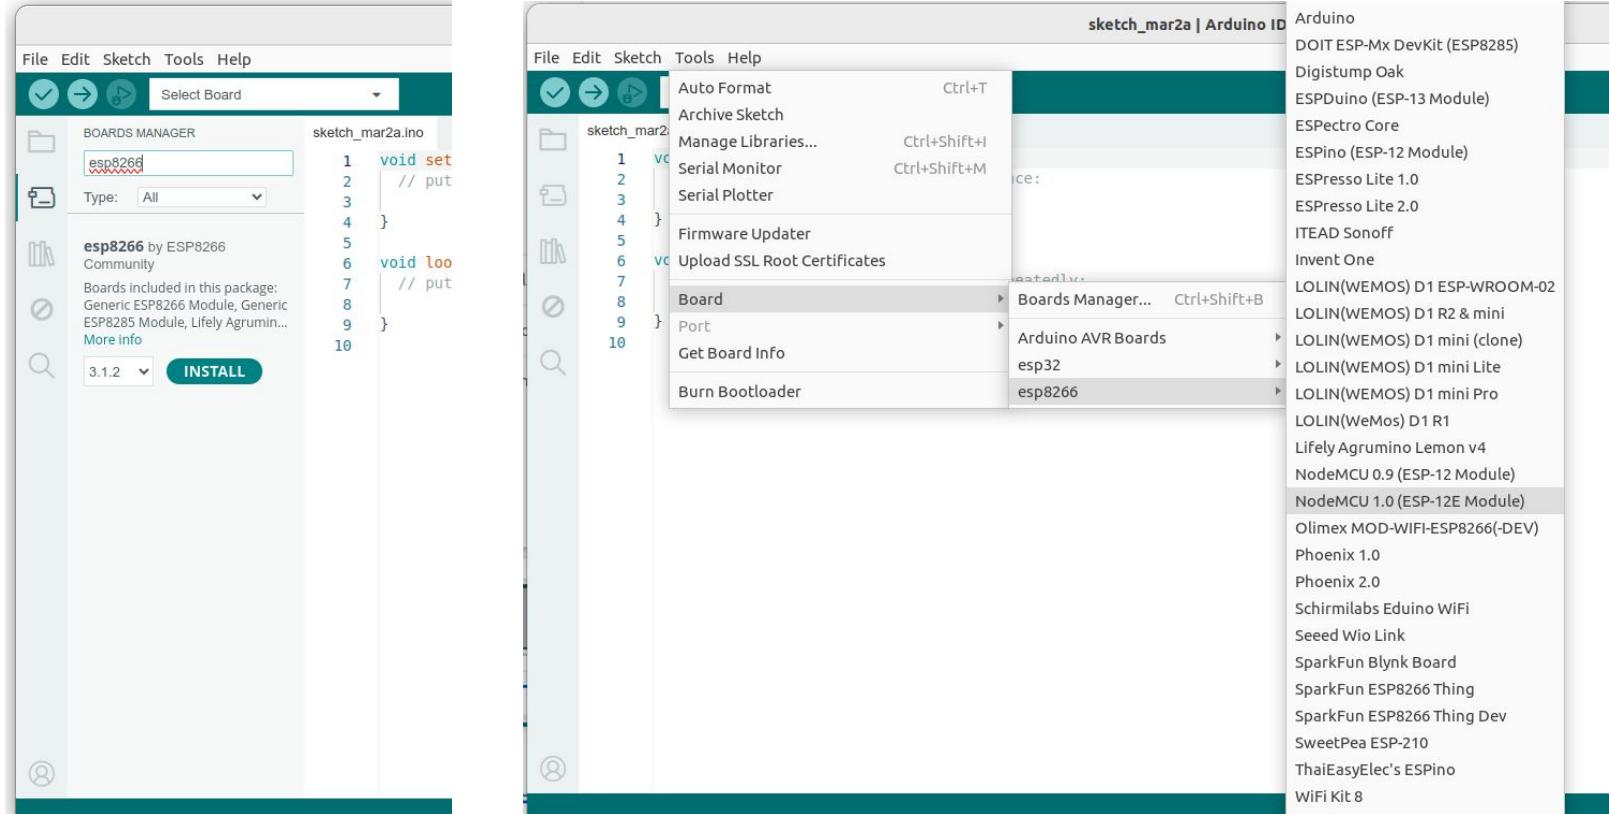

Arduino: agregar soporte para nuestro MCU

Agregar soporte para NodeMCU: http://arduino.esp8266.com/stable/package_esp8266com_index.json

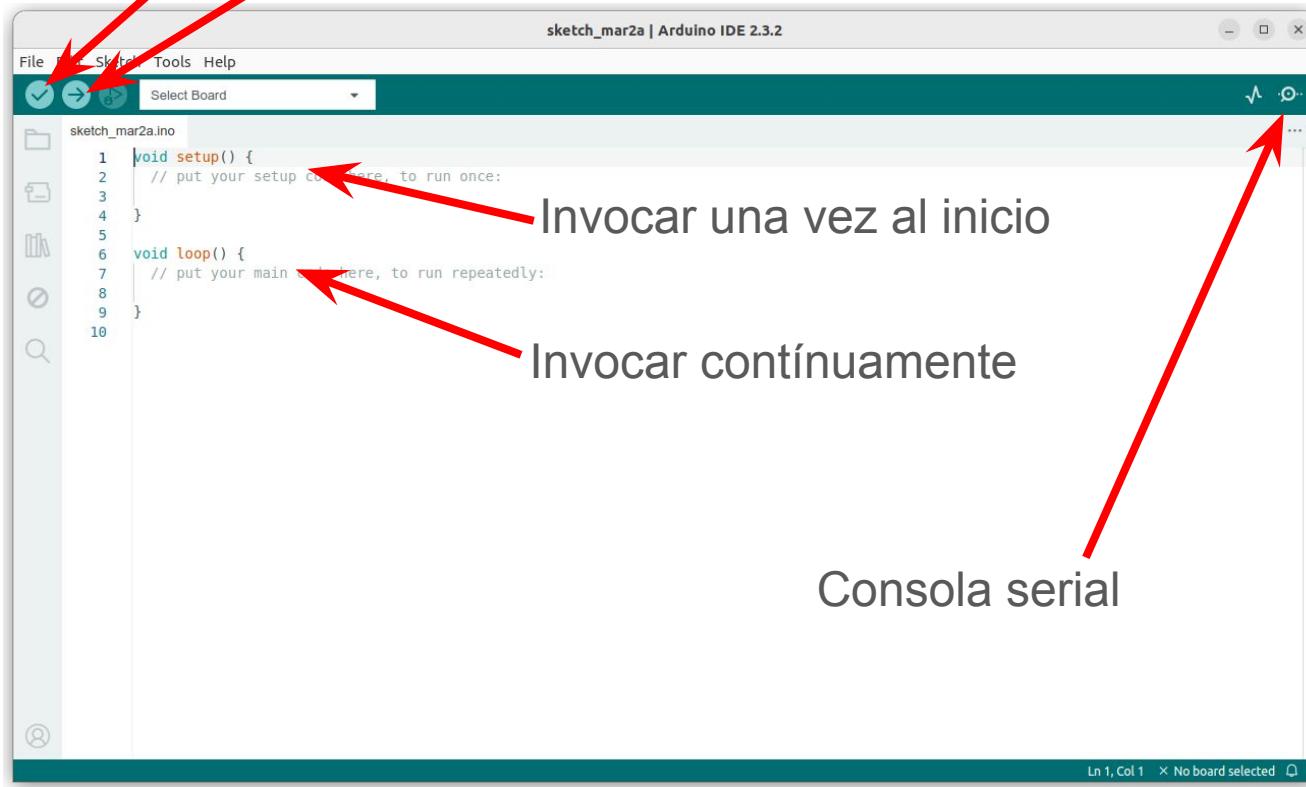

Arduino: agregar soporte para nuestro MCU

Arduino

Verificar (compilar)

Instalar (“flashear”)

Arduino: consola

```
void setup() {  
    Serial.begin(115200);  
    Serial.println("Hello World!");  
}  
  
void loop() {  
}
```

```
void setup() {  
    Serial.begin(115200);  
}  
  
void loop() {  
    Serial.println("Hello World!");  
}
```

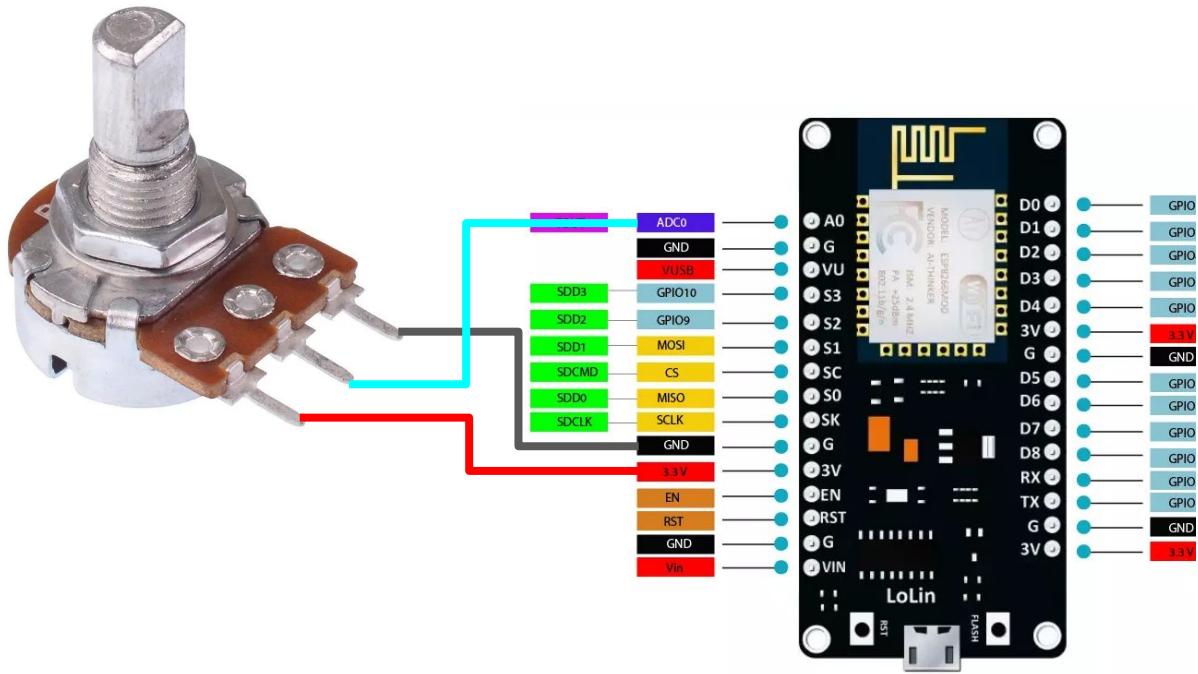

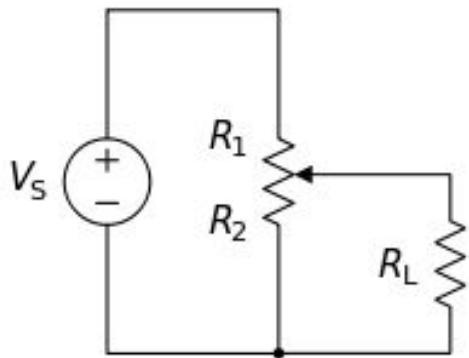

Arduino: escribir en pin digital

```
void setup() {  
    Serial.begin(115200);  
    pinMode(D4, OUTPUT); // LED pin as output.  
    Serial.println("\n\nLED pin: " + String(D4));  
}  
  
void loop() {  
    Serial.print("1 ");  
    digitalWrite(D4, HIGH);  
    delay(1000);  
    Serial.print("0 ");  
    digitalWrite(D4, LOW);  
    delay(1000);  
}
```

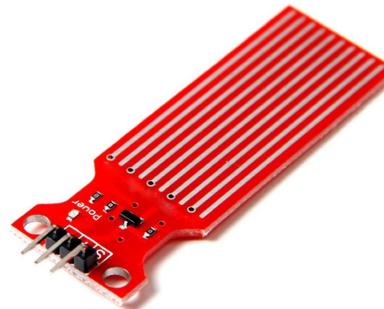

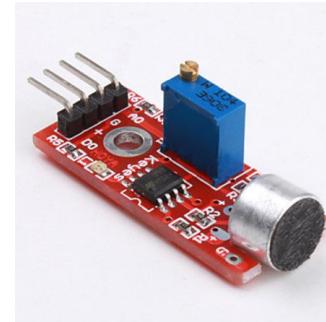

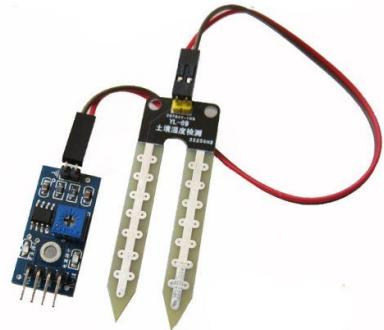

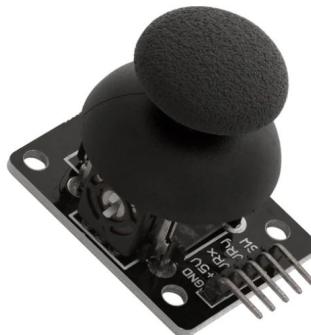

Cómo se lee un sensor analógico

Arduino: cablear una resistencia variable

Sensores analógicos

Arduino: conversor analógico-digital (ADC)

```
int last_change = 0;
int led_state = 0;

void setup() {
    pinMode(LED_BUILTIN, OUTPUT); // LED pin as output.
    Serial.begin(115200);
    Serial.println("\n\nLED pin: " + String(LED_BUILTIN));
}

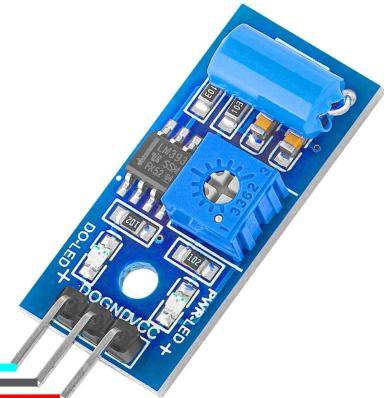

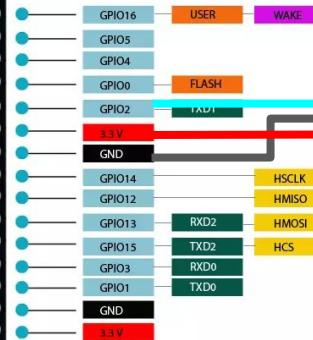

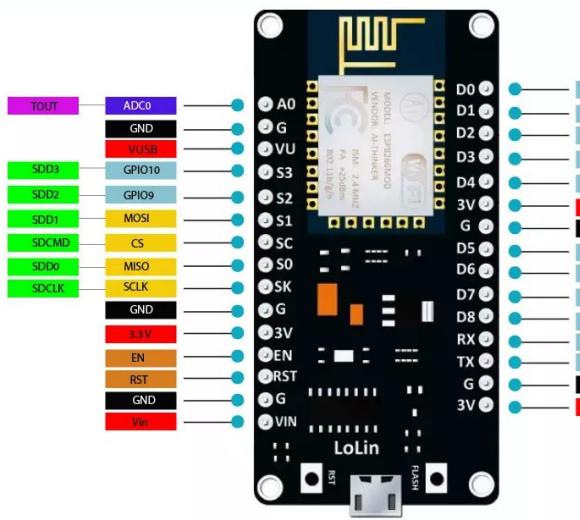

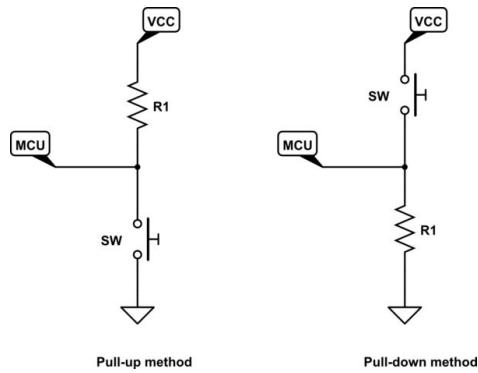

void loop() {
    int now = millis();
    int delay = analogRead(A0);
    Serial.println(String(delay));

    if (now - last_change > delay) {
        last_change = now;
        led_state = 1 - led_state;
        digitalWrite(LED_BUILTIN, led_state);
    }
}
```

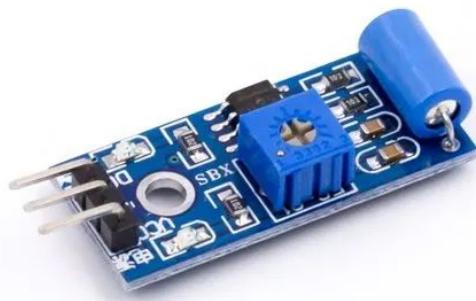

Cómo se lee un sensor digital

Arduino: cablear un sensor digital

Sensores digitales

Arduino: leer un sensor digital (polling)

```
const int buttonPin = D2;

void setup() {
  Serial.begin(115200);
  pinMode(buttonPin, INPUT);
}

void loop() {
  int buttonState = digitalRead(buttonPin);
  if (buttonState == HIGH) {
    Serial.println("on");
  } else {
    Serial.println("off");
  }
}
```

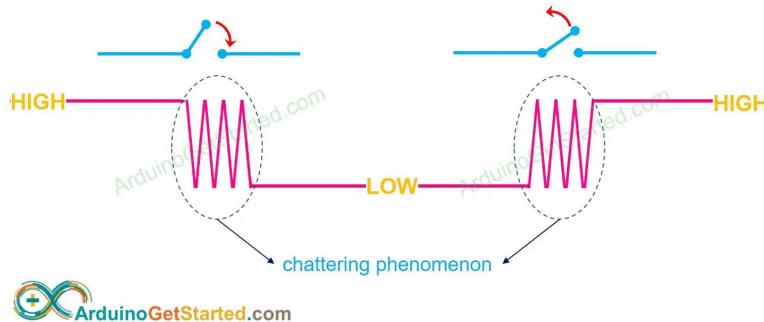

```
const int buttonPin = D2;
int lastState = LOW;

void setup() {
  Serial.begin(115200);
  pinMode(buttonPin, INPUT);
}

void loop() {
  int buttonState = digitalRead(buttonPin);
  if (lastState != buttonState) {
    Serial.println(buttonState);
    lastState = buttonState;
  }
}
```

Arduino: leer un sensor digital (*debounce*)

```
#define BOUNCE_TIME 50
static int lastDigitalOn = 0;

...
if( digitalRead(button) && (millis()-lastDigitalOn > BOUNCE_TIME) ) {
    lastDigitalOn = millis();
    // do something
}
...
```

Arduino: leer un sensor digital (interrupciones)

```
const int buttonPin = D2;  
volatile byte clicked = 0;  
  
void setup() {  
    Serial.begin(115200);  
    pinMode(buttonPin, INPUT);  
    attachInterrupt(digitalPinToInterrupt(buttonPin), click, RISING);  
}  
  
void loop() {  
    if (clicked == 1) {  
        Serial.println(millis());  
        clicked = 0;  
    }  
}  
  
ICACHE_RAM_ATTR void click() {  
    clicked = 1;  
}
```

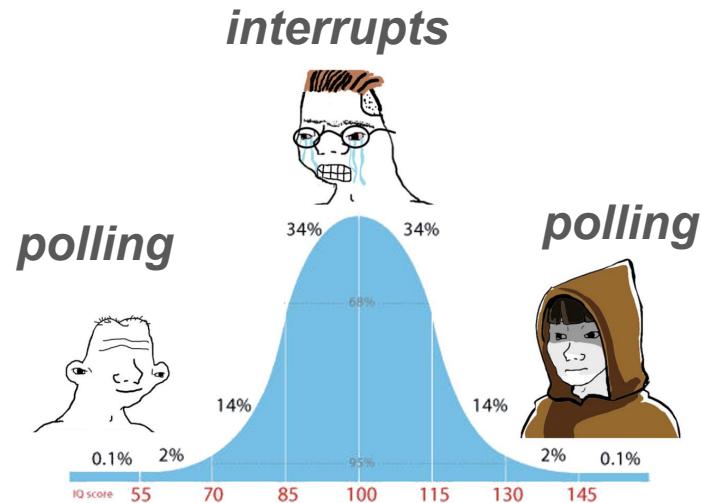

Arduino: leer un sensor digital (interrupciones)

- Interrupciones en CHANGE / FALLING / RISING
- Los handlers de las interrupciones no reciben ni devuelven parámetros
 - Deben comunicarse con el resto del programa mediante variables globales
- Las variables globales que se actualizan en un handler deben ser declaradas volatile.
- Los handlers deben ser declarados ICACHE_RAM_ATTR .
- Se pueden proteger secciones de código con noInterrupts() / interrupts(); Usar responsablemente.
- Una interrupción no interrumpe a otra interrupción
 - Durante una interrupción “nada sucede”
 - El tiempo (millis()) no avanza
 - El handler debe ser lo más corto y rápido posible
 - No usar delay()
 - En lo posible, no usar el puerto serial, que incluye la consola

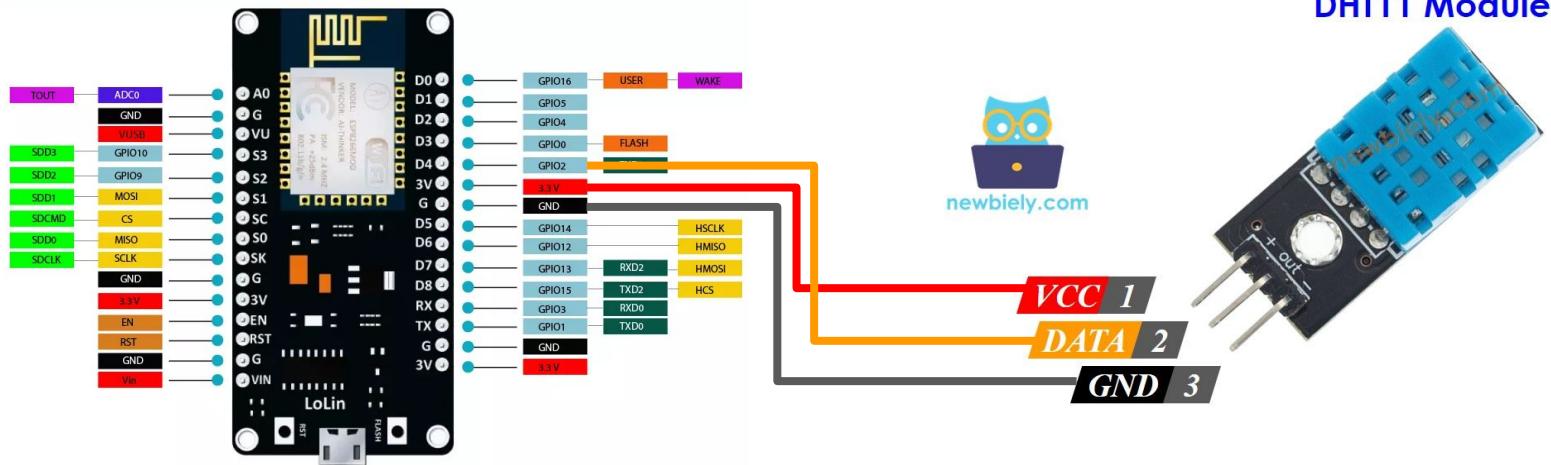

Arduino: leer un sensor digital (interrupciones)

- Polling: fácil, obtuso, tendencia a ineficiente y confuso.
- Interrupciones: elegantes, sutiles, eficientes, peligrosas.

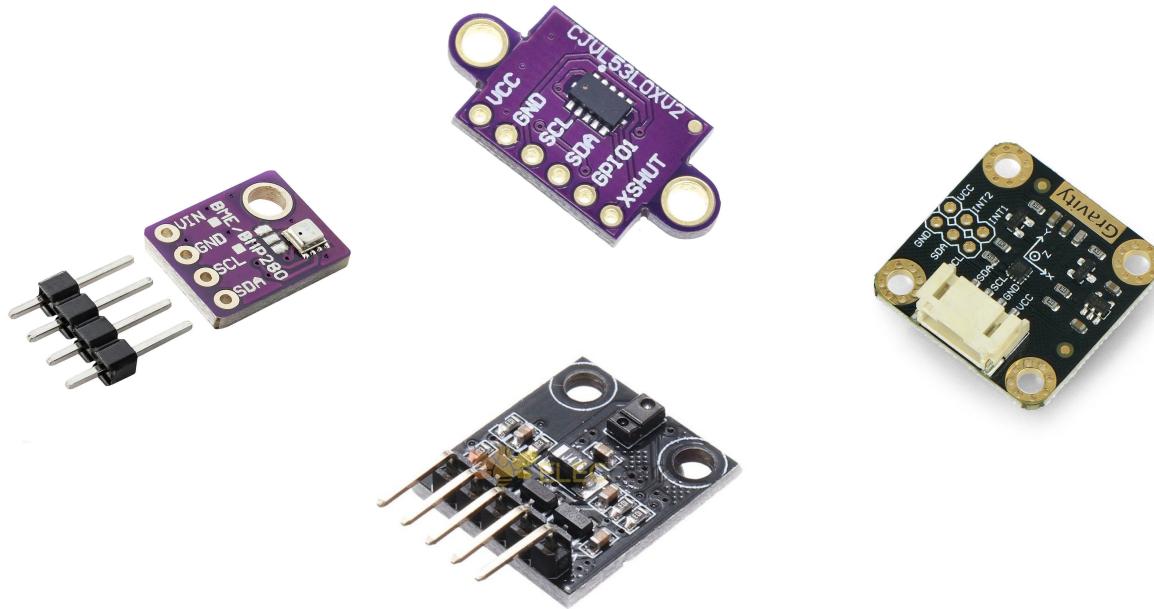

Cómo se lee un sensor basado en
un protocolo (ej: 1-wire)

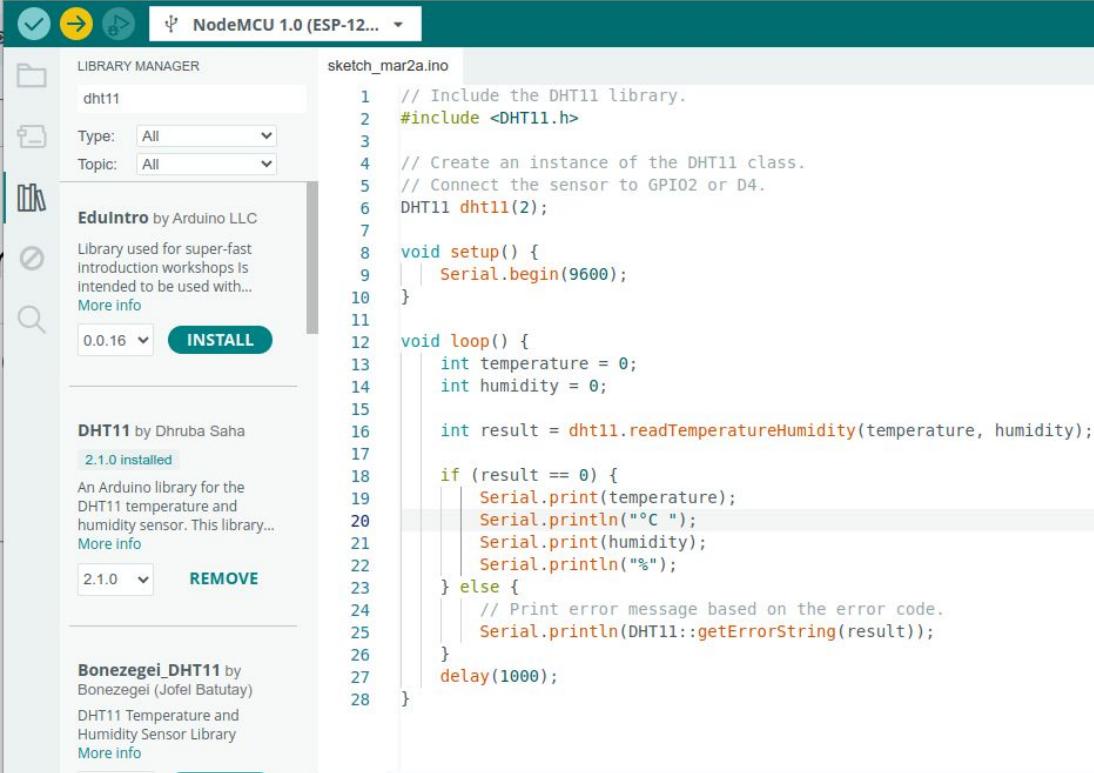

Arduino: cablear un sensor 1-wire

Sensores 1-wire, I²C, SPI...

Arduino: agregar y usar la biblioteca de un sensor

The screenshot shows the Arduino IDE Library Manager interface. The title bar indicates the board is set to NodeMCU 1.0 (ESP-12...). The left sidebar lists three libraries: 'dht11' by EduIntro, 'DHT11' by Dhruba Saha, and 'Bonezegei_DHT11' by Bonezegei (Jofel Batutay). The 'dht11' entry is selected, showing its details: Type: All, Topic: All, Version: 0.0.16, and an 'INSTALL' button. The main panel displays the code for 'sketch_mar2a.ino' which includes the DHT11 library and prints temperature and humidity to the serial port.

```
1 // Include the DHT11 library.
2 #include <DHT11.h>
3
4 // Create an instance of the DHT11 class.
5 // Connect the sensor to GPIO2 or D4.
6 DHT11 dht11(2);
7
8 void setup() {
9     Serial.begin(9600);
10 }
11
12 void loop() {
13     int temperature = 0;
14     int humidity = 0;
15
16     int result = dht11.readTemperatureHumidity(temperature, humidity);
17
18     if (result == 0) {
19         Serial.print(temperature);
20         Serial.println("°C ");
21         Serial.print(humidity);
22         Serial.println("%");
23     } else {
24         // Print error message based on the error code.
25         Serial.println(DHT11::getErrorString(result));
26     }
27     delay(1000);
28 }
```

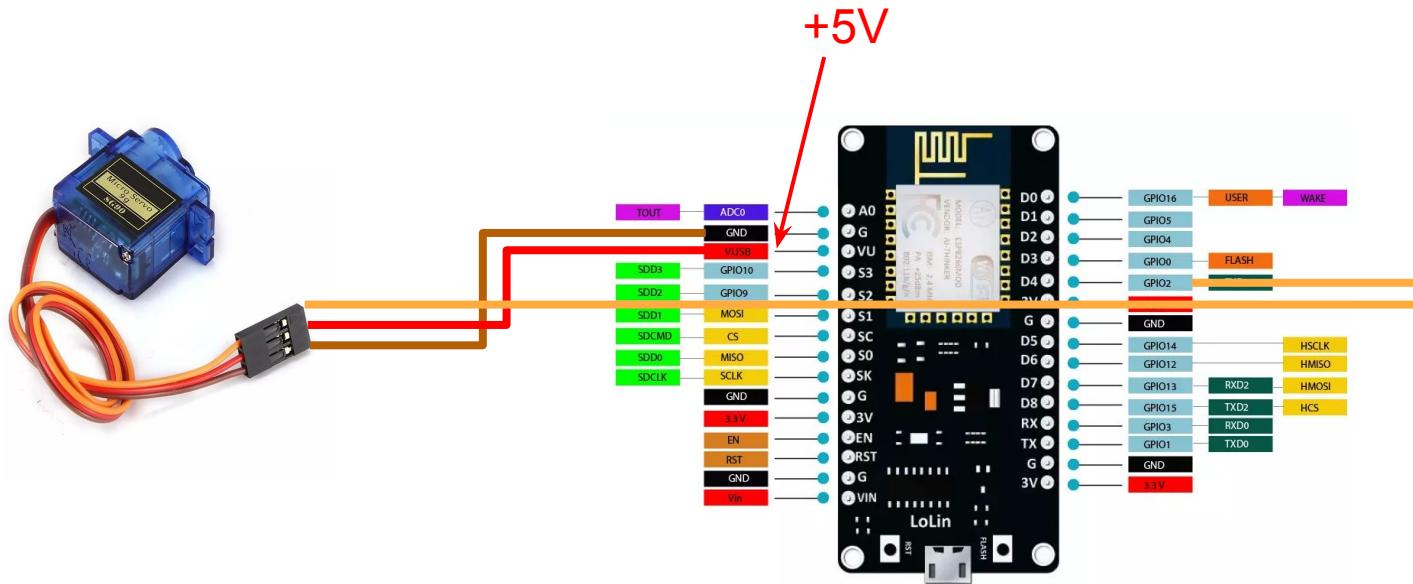

Arduino: leer sensor DHT11

```
#include <DHT11.h> // Include the DHT11 library.  
DHT11 dht11(D4); // Connect the sensor to GPIO2 (D4)  
  
void setup() {  
    Serial.begin(115200);  
}  
  
void loop() {  
    int temperature = 0;  
    int humidity = 0;  
  
    int result = dht11.readTemperatureHumidity(temperature, humidity);  
    if (result == 0) {  
        Serial.print(temperature); Serial.print("°C ");  
        Serial.print(humidity); Serial.println("%");  
    } else {  
        Serial.println(DHT11::getErrorString(result));  
    }  
    delay(1000);  
}
```

Cómo se controla un servo-motor

Arduino: cablear un servo-motor

Arduino: controlar un servo-motor

```
#include <Servo.h>
Servo servol;

void setup() {
    Serial.begin(115200);
    servol.attach(D4); // servo attach D4 pin of arduino
}

void loop() {
    Serial.println(0);
    servol.write(0);
    delay(1000);

    Serial.println(180);
    servol.write(180);
    delay(1000);
}
```

The screenshot shows the Arduino IDE interface. At the top, there's a toolbar with icons for file operations and a dropdown menu set to "NodeMCU 1.0 (ESP-12...)".

The main area is divided into two sections: "LIBRARY MANAGER" on the left and "sketch_mar2a.ino" on the right.

In the "LIBRARY MANAGER" section, the search bar contains "thingspeak". Under the "Type: All" and "Topic: All" filters, a library named "ThingSpeak by MathWorks..." is listed. It has a green "2.0.1 installed" badge, a description "ThingSpeak Communication Library for Arduino, ESP8266 & ESP32 ThingSpeak (...)", and a "More info" link. Below it, another entry "ThingSpeak_asukiaaaa" by Asuki Kono is shown with the note "An API manager for ThingSpeak It writes field values for".

The "sketch_mar2a.ino" section displays the following code:

```
#include "ThingSpeak.h"
unsigned long myChannelNumber = 2454031;
const char * myWriteAPIKey = "7QYPX39RABNLVJR3";
#include <ESP8266WiFi.h>

char ssid[] = "wifing"; // your network SSID (name)
char pass[] = "wifing-pub"; // your network password
WiFiClient client;

void setup() {
  Serial.begin(115200);
  delay(100);
  WiFi.mode(WIFI_STA);
  ThingSpeak.begin(client);
}

void loop() {
  // Connect or reconnect to WiFi
}
```

Publiquemos en thingspeak (1 campo)

```
#include "ThingSpeak.h"
