Ejercicio 9.

- a. Para n y t positivos, repasar la demostración (hay al menos dos posibles demostraciones) que el coeficiente de $x_1^{n_1} x_2^{n_2} \dots x_t^{n_t}$ en $(x_1 + x_2 + \dots + x_t)^n$ es

$$\frac{n!}{n_1! n_2! \dots n_t!}$$

con $n_1 + n_2 + \dots + n_t = n$.

- b. (Ej. 3 del 1^{er} parcial del 2001) Determinar el coeficiente de x^4 en el desarrollo de $(x^3 - x^2 + x - 1)^6$.

$$(x^3 - x^2 + x - 1) \cdots (x^3 - x^2 + x - 1)$$

Formas de conseguir x^4 :

$$\begin{aligned} (x^3) \cdot (x) \cdot (-1)^4 &= x^4 \rightarrow C_1^6 \cdot C_1^5 \cdot C_4^4 = 30 = PR_{1,1,4}^6 \\ (-x^2)^2 \cdot (-1)^4 &= x^4 \rightarrow PR_{2,4}^6 = \frac{6!}{4!2!} = \frac{30}{2} = 15 \\ (-x^2) \cdot (x)^2 \cdot (-1)^3 &= x^4 \rightarrow PR_{1,2,3}^6 = \frac{6!}{2!3!} = \frac{6 \cdot 5 \cdot 4}{2} = 60 \\ (x)^4 \cdot (-1)^2 &= x^4 \rightarrow PR_{2,4}^6 = 15 \end{aligned}$$

$$PR_{n_1, \dots, n_t}^n = \frac{n!}{n_1! \cdots n_t!} = C_{n_1}^n \cdot C_{n_2}^{n-n_1} \cdots C_{n_t}^{n-t}$$

Respuesta: 120

Ejercicio MO3:

Considere la sucesión a_n que verifica $a_0 = 1$ y para todo $n \geq 0$:

$$a_{n+1} = a_0 a_n + a_1 a_{n-1} + \dots + a_n a_0 = \sum_{i=0}^n a_i a_{n-i}.$$

Si $f(x)$ es la función generatriz de a_n , entonces $f(1/4)$ vale:

$$C_n = a_n * b_n := \sum_{i=0}^n a_i \cdot b_{n-i}$$

$$\rightarrow Q_{n+1} = Q_n * Q_n$$

Teorema: Si $A(x) = \sum_{n=0}^{\infty} a_n x^n$ y $B(x) = \sum_{n=0}^{\infty} b_n x^n \Rightarrow A(x) \cdot B(x) = \sum_{n=0}^{\infty} (a_n * b_n) x^n$

$$\text{Obs: } f(x) = \sum_{n=0}^{\infty} a_n x^n \Rightarrow \sum_{n=0}^{\infty} a_{n+1} x^n = a_1 + a_2 x + a_3 x^2 + \dots$$

$$\Rightarrow x \sum_{n=0}^{\infty} a_{n+1} x^n = a_1 x + a_2 x^2 + a_3 x^3 + \dots = f(x) - a_0$$

$$x \sum_{n=0}^{\infty} (a_n * a_n) x^n = x [f(x)]^2$$

$$\Rightarrow x [f(x)]^2 = f(x) - a_0 \Rightarrow xf(x)^2 - f(x) + a_0 = 0 \quad a_0 = 1$$

$$xf(x)^2 - f(x) + 1 = 0 \Rightarrow \frac{1}{4} \underbrace{f(1/4)}_u^2 - f(1/4) + 1 = 0 \Rightarrow \frac{1}{4} u^2 - u + 1 = 0$$

$$\Rightarrow u^2 - 4u + 4 = 0 \Rightarrow (u-2)^2 = 0 \Rightarrow u = 2$$

Ejercicio 11. (Examen Diciembre 2009)

Resolver el siguiente sistema de relaciones de recurrencia:

$$A(x) = \sum_{n=0}^{\infty} a_n x^n$$

$$B(x) = \sum_{n=0}^{\infty} b_n x^n$$

$$\begin{cases} a_n = -a_{n-1} - b_n \\ b_{n+1} = b_n - 3a_{n-1} \\ a_0 = 0, b_0 = 2, b_1 = 1 \end{cases}$$

$$a_n x^n = -a_{n-1} x^n - b_n x^n \Rightarrow$$

$$\sum_{n=1}^{\infty} a_n x^n = -\sum_{n=1}^{\infty} a_{n-1} x^n - \sum_{n=1}^{\infty} b_n x^n \Rightarrow$$

$$A(x) - \cancel{a_0}^0 = -\sum_{n=0}^{\infty} a_n x^{n+1} - (B(x) - \cancel{b_0}^2) \Rightarrow$$

$$A(x) = x A(x) - B(x) + 2 \Rightarrow$$

$$(1-x)A(x) + B(x) = 2 \Rightarrow B(x) = 2 - (1-x)A(x) = 2 + (x-1)A(x)$$

$$b_{n+1} x^n = b_n x^n - 3a_{n-1} x^n \Rightarrow \sum_{n=1}^{\infty} b_{n+1} x^n = \sum_{n=1}^{\infty} b_n x^n - 3 \sum_{n=1}^{\infty} a_{n-1} x^n$$

$$\Rightarrow \sum_{n=1}^{\infty} b_{n+1} x^{n+1} = x \sum_{n=1}^{\infty} b_n x^n - 3x^2 \sum_{n=1}^{\infty} a_{n-1} x^{n-1} \Rightarrow$$

$$B(x) - b_0 - b_1 x = x(B(x) - b_0) - 3x^2 A(x) \Rightarrow$$

$$B(x) - 2 - x = x(B(x) - 2) - 3x^2 A(x) \Rightarrow$$

$$3x^2 A(x) + (1+x)B(x) = 2 - x \Rightarrow$$

$$3x^2 A(x) + (1+x)(2+(x-1)A(x)) = 2 - x$$

$$\Rightarrow (3x^2 + (x^2 - 1))A(x) + \cancel{2+2x} = \cancel{2-x}$$

$$\Rightarrow (4x^2 - 1)A(x) = -3x \Rightarrow A(x) = \frac{-3x}{4x^2 - 1} = \frac{3x}{1-4x^2}$$

$$= 3 \frac{x}{1-4x^2} = 3 \cdot x \cdot \frac{1}{1-4x^2} = 3 \cdot x \cdot \frac{1}{1-(2x)^2} = 3x \sum_{n=0}^{\infty} (4x^2)^n$$

$$\frac{1}{1-x^2} = \sum_{n=0}^{\infty} (x^2)^n = \sum_{n=0}^{\infty} 3 \cdot 4^n x^{2n+1} \Rightarrow q_{2n} = 0 \\ q_{2n+1} = 3 \cdot 4^n \\ m \quad 3 \cdot 4^{\frac{m-1}{2}}$$

$$(c) c_{n+2} + 4c_n = 0, \quad \forall n \in \mathbb{N}, \text{ con } c_0 = c_1 = 1.$$

$$C_{n+2} = -4C_n \Rightarrow C_{2n} = (-4)^n \quad C_0 = (-4)^0 \\ C_{2n+1} = (-4)^n$$

$$C_n = 1, 1, -4, -4, 16, 16, -64, -64, \dots$$
